Muscle stiffness, spasms, shakiness, abnormal movements

Medications for thought disorder can cause:

- ◆ Tremors, muscle rigidity, & shuffling walk
 - ◆ Restlessness, where it is almost impossible to sit still
 - ◆ Abnormal movements that you cannot control (such as tongue thrusting, puckering)
 - ◇ Can be reversed if caught early, otherwise movements can worsen and become irreversible
 - ◇ *In rare cases*, abnormal movements can become a medical emergency
- For example:
- * Muscle spasm that occurs in the throat
 - * Severe muscle stiffness along with fever

What should I do if I experience any of these side effects?

Tell your prescriber right away. They can give you something to help with these side effects

Risk for weight gain and diabetes

Medications for thought disorder can cause:

- ◇ Weight gain
- ◇ Increased blood sugar
- ◇ Increased cholesterol (fats in the blood) & blood pressure

Which can lead to:

- ◆ Diabetes
- ◆ Heart disease

How can I prevent this?

- ⇒ Eat a diet low in fat & sugar
- ⇒ Exercise at least 30 minutes a day, 5 times per week
- ⇒ Have labs done on a regular basis to monitor your blood sugars and fats
- ⇒ If your levels become too high, or if you gain too much weight, your prescriber can change your medication

Alameda County Behavioral Health Care Services - Office of the Medical Director, Pharmacy Department

Side Effects

clozapine (Clozaril®) & olanzapine (Zyprexa®)

- Weight gain
- Increased appetite
- Increased fats & sugars in the blood
- **Agranulocytosis (with clozapine)** - a rare, but dangerous decrease in white blood cells that can lead to deadly infections. There are important blood monitors to prevent these side effects

aripiprazole (Abilify®)

- Up to 15% of clients reported restlessness (inability to sit still)
- Headache, anxiety, and upset stomach are commonly reported

Alameda County Behavioral Health Care Services - Office of the Medical Director, Pharmacy Department
Created by: Dri Wang, Pharm.D., BCPP
Designed by: Dri Wang Pharm.D., BCPP & Cassie Chan, CPhT

Side Effects

asenapine (Saphris®)

- Insomnia (difficulty sleeping or staying asleep) or sleepiness
- Numbness in the mouth after dissolving the disintegrating tablet under the tongue
- Headache, restlessness, weight gain, and increased cholesterol

quetiapine (Seroquel®)

- Dizziness, drowsiness, dry mouth, and constipation are the most common side effects
- Mild weight gain (in about 20% of clients)
- Moderate weight gain (in about 10% of clients)
- Increased appetite
- Increased fats and sugars in the blood

Alameda County Behavioral Health Care Services - Office of the Medical Director, Pharmacy Department
Created by: Dri Wang, Pharm.D., BCPP
Designed by: Dri Wang Pharm.D., BCPP & Cassie Chan, CPhT

Side Effects

iloperidone (Fanapt®)

- Dizziness and fast heartbeat (may occur in the beginning of therapy, often goes away with time)
- Dry mouth and nasal congestion

lurasidone (Latuda®)

- Sleepiness, restlessness, tremors, and nausea

haloperidol (Haldol®)

- Muscle stiffness, spasms, restlessness, and shakiness may appear
- Clients on this medication long term can get uncontrollable movements (for example, in lips or mouth)

Alameda County Behavioral Health Care Services - Office of the Medical Director, Pharmacy Department
Created by: Dri Wang, Pharm.D., BCPP
Designed by: Dri Wang Pharm.D., BCPP & Cassie Chan, CPhT

Side Effects

risperidone (Risperdal®)

- Dizziness (may occur in the beginning of therapy, often goes away with time)
- Muscle stiffness, spasms, or restlessness (in about 2% of clients)
- Increased chance of high prolactin
Signs of high prolactin:
 - * absence of period (women)
 - * loss of sexual functioning and breast growth (men)

ziprasidone (Geodon®)

- Insomnia (difficulty falling asleep or staying asleep) occurs in about 30% of clients
- Restlessness and muscle spasms or stiffness
- Rarely, heart rhythm disturbances can occur so monitoring may be needed. Tell your prescriber if you have a history of heart problems

Alameda County Behavioral Health Care Services - Office of the Medical Director, Pharmacy Department

Sleepiness

Medications for thought disorder that may cause sleepiness

High:

- ◆ clozapine (Clozaril®)
- ◆ olanzapine (Zyprexa®)
- ◆ quetiapine (Seroquel®)

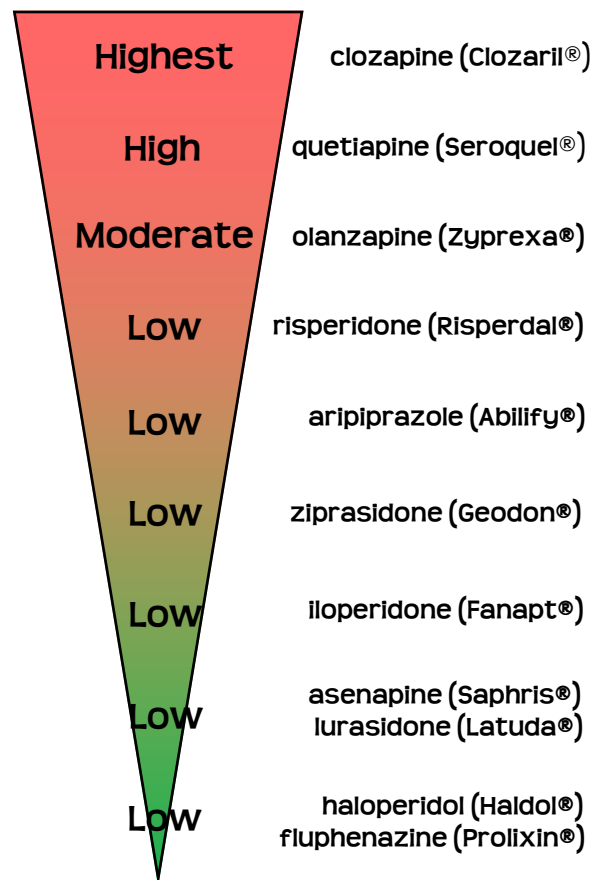

Low to moderate:

- ◆ aripiprazole (Abilify®)
- ◆ risperidone (Risperdal®)
- ◆ ziprasidone (Geodon®)
- ◆ asenapine (Saphris®)
- ◆ iloperidone (Fanapt®)
- ◆ lurasidone (Latuda®)
- ◆ haloperidol (Haldol®)
- ◆ fluphenazine (Prolixin®)

Dry mouth, blurry vision & constipation

Alameda County Behavioral Health Care Services - Office of the Medical Director, Pharmacy Department
Created by: Dri Wang, Pharm.D., BCPP
Designed by: Dri Wang Pharm.D., BCPP & Cassie Chan, CPhT

Dry mouth, blurry vision & constipation

Certain medications for thought disorder may worsen:

- Dry mouth
- Blurry vision
- Urinary retention (hard to pee)
- Constipation (hard to poop)

- ⇒ In a large study, **quetiapine (Seroquel®)** was reported as being the worst in this set of side effects, when compared to other medications for thought disorder
- ⇒ In a large clinical trial, 22% of patients taking **olanzapine (Zyprexa®)** experienced dry mouth, 9% reported constipation
- * Higher doses of **olanzapine (Zyprexa®)** tend to cause more of these type of side effects

Alameda County Behavioral Health Care Services - Office of the Medical Director, Pharmacy Department
Created by: Dri Wang, Pharm.D, BCPP
Designed by: Dri Wang Pharm.D., BCPP & Cassie Chan, CPhT

Sleepiness

- ⇒ Younger clients tend to get sleepier when taking **aripiprazole (Abilify®)** compared to older clients
- ⇒ The highest dose of **aripiprazole (Abilify®)** also tends to cause more sleepiness

- ⇒ In a large study, insomnia (difficulty falling asleep or staying asleep) was one of the most reported side effects of **ziprasidone (Geodon®)** in about 30% of clients
- ⇒ Some clients may even experience sleepiness from it

Alameda County Behavioral Health Care Services - Office of the Medical Director, Pharmacy Department
Created by: Dri Wang, Pharm.D, BCPP

Sexual Side Effects

Minimal to None:

- aripiprazole (Abilify®)
- ziprasidone (Geodon®)
- clozapine (Clozaril®)
- olanzapine (Zyprexa®)
- quetiapine (Seroquel®)
- asenapine (Saphris®)
- lurasidone (Latuda®)

Increased chance:

- risperidone (Risperdal®)
- haloperidol (Haldol®)
- fluphenazine (Prolixin®)
- iloperidone (Fanapt®)

Restlessness

haloperidol (Haldol®),
 fluphenazine (Prolixin®)

aripiprazole (Abilify®)

lurasidone (Latuda®),
 risperidone (Risperdal®)

asenapine (Saphris®)

ziprasidone (Geodon®)

olanzapine (Zyprexa®)

quetiapine (Seroquel®)
 clozapine (Clozaril®)

Alameda County Behavioral Health Care Services - Office of the Medical Director, Pharmacy Department

Restlessness

What is restlessness?

- Restlessness can develop several days or weeks after you start taking the medication
- Often described as an uncomfortable feeling, leading to difficulty sitting still
- May range from anxious feeling to severe discomfort, particularly in the knees. Some clients pace for hours to relieve the pressure

- ⇒ Studies show the highest rate of restlessness with **haloperidol (Haldol®)** and **fluphenazine (Prolixin®)** in 25-36% of clients
- ⇒ In several trials, **aripiprazole (Abilify®)** also shows a high rate of restlessness in 10-15% of clients

I am experiencing symptoms, is there any relief?

There are medications that your prescriber can give you to relieve this side effect

Alameda County Behavioral Health Care Services - Office of the Medical Director, Pharmacy Department

Sexual Side Effects

*Some medications for thought disorder can cause an increase in **prolactin**.*

What is prolactin?

Prolactin is the hormone that causes milk production and can cause sexual problems

For women: Increased prolactin may disrupt your menstrual cycle or reduce sexual desire

For men: Increased prolactin can result in breast growth. Sexual side effects may also include delayed or inability to ejaculate and difficulty achieving erection

What should I do if I am experiencing these side effects?

Tell your prescriber if you are experiencing disruption in sexual functioning, such as a decrease in sexual desire in comparison to before starting the medication

Dizziness

clozapine (Clozaril®)	 19%
iloperidone (Fanapt®)	 10-20 %
quetiapine (Seroquel®)	 10-18 %
aripiprazole (Abilify®)	 11 %
risperidone (Risperdal®)	 9 %
ziprasidone (Geodon®)	 8 %
asenapine (Saphris®)	 3-11 %
lurasidone (Latuda®)	 4 %
olanzapine (Zyprexa®)	 2.6 %
haloperidol (Haldol®) fluphenazine (Prolixin®)	Not reported

Starting medications

What are some common symptoms that medications for thought disorder help with?

- Seeing & hearing something that is not there
- Fearful feelings and confusion
- Paranoia or suspiciousness
- Agitation, aggression, or hostility
- Rapid thoughts
- Pacing and restlessness
- Fluctuations in mood
- Insomnia

What can I expect when starting the medication?

- ⇒ It can help calm & clear confusion in a person who is hearing or seeing things that are not there
- ⇒ It can take up to 4-6 weeks to reach their full effect
- ⇒ Helps to *control* symptoms, but does not *cure* them

- ⇒ When taken long term, prevents the same symptoms from returning
- ⇒ When combined with family therapy, peer support, and housing & employment supports, can be very helpful in managing symptoms

Alameda County Behavioral Health Care Services - Office of the Medical Director, Pharmacy Department
Created by: Dri Wang, Pharm.D., BCPP

Starting medications

How long should I take the medication for?

- Take the medication until the symptoms are relieved, then talk to your prescriber about whether or not to continue
- You may need to continue taking it to prevent symptoms from occurring
- If starting for long-term treatment, take it for at least a month before deciding whether or not it is working for you

How do I cut down or stop taking the medication?

- ⇒ **Do it slowly!** A sudden change in your dose increases the risk of your symptoms returning or becoming more intense
- ⇒ Stopping can cause withdrawal effects, such as:
- * Nausea
 - * Vomiting
 - * Diarrhea
 - * Stomach pain
 - * Dizziness
 - * Shakiness

⇒ Talk to your prescriber about decreasing or stopping your medication. They may have you decrease the dose a little at a time (for example, 1-3 weeks between each dose reduction)

Dizziness

Why does my medication for thought disorder make me feel dizzy?

Dizziness often happens due to a drop in blood pressure when the medication is first started

Dizziness usually goes away with time. During this time period, it is important to get up slowly from a lying or sitting position

What can I do to help with the dizziness?

Before getting up from bed in the morning, you can sit at the edge of the bed and dangle your feet before standing up. This allows blood to re-circulate throughout your entire body and avoid the sudden drop in blood pressure
